Implementation plan:	Review Microsoft sign-in logs to verify login source, IP address, device, and authentication method. Confirm with the user whether the login activity was recognized or unauthorized. If suspicious activity is confirmed, force password reset, revoke active sessions, verify MFA enrollment, and review mailbox forwarding rules, inbox rules, and delegate permissions for indicators of compromise. Escalate to Security for deeper investigation if unauthorized access or persistence mechanisms are identified.				
Backout plan:	If account access issues occur after password reset or MFA re-registration, restore user access through verified identity validation and administrator-assisted credential recovery. Re-enable required access while maintaining security controls and continued monitoring.				
Test plan:	Confirm successful password reset and secure login using MFA. Verify no unauthorized mailbox forwarding rules, inbox rules, or delegate permissions remain. Review sign-in logs to ensure no continued suspicious access attempts are present after remediation.				
Root cause:	User received a Microsoft security alert triggered by a login attempt from an unfamiliar geographic location. Initial investigation suggests either credential exposure, password reuse, phishing risk, or failed unauthorized access attempt requiring validation and containment.				
Workaround:	Temporary access maintained by securing the account through password reset and session revocation while preserving business continuity. User advised to avoid approving unexpected MFA prompts and report any additional suspicious notifications immediately.				

Description

User received an alert showing a login attempt from an unfamiliar location and wants account reviewed.

Comments

Comment by [com.cylo7](#) [07/May/26]

Initial triage started for suspicious Microsoft account login alert. Reviewing sign-in activity to verify source location, IP address, device, and MFA status. User has been contacted to confirm whether the login attempt was recognized or unauthorized. If suspicious activity is confirmed, password reset, session revocation, MFA verification, and mailbox rule review will be performed. Escalation to Security team will follow if compromise indicators are identified.

Comment by [Sid Hurley](#) [07/May/26]

Security investigation completed. Unauthorized login attempt was identified and contained before successful account compromise occurred. Password reset was completed, active sessions were revoked, MFA was verified, and mailbox forwarding/inbox rules were reviewed with no malicious persistence found. No evidence of data exposure, privilege escalation, or lateral movement detected. User account secured and monitoring completed.

Comment by [com.cylo7](#) [07/May/26]

User account reviewed following Microsoft suspicious login alert. Unauthorized login attempt was investigated and contained successfully. Security review completed with password reset, session revocation, MFA validation, and mailbox rule verification. No compromise persistence found and account access restored securely. User notified and incident resolved.
